CONTENT

Chapter 1 Introduction..... 2

Chapter 2 Global strength analysis by 1D - beam method, in the case of oblique equivalent quasi-static wave load…….. 3
2.1 Theoretical background..... 3
2.2 Global strength analysis under oblique equivalent quasi-static waves of a testing barge, by the 1D-beam method..... 9
2.3 Analytical solution for the prismatic barge hull……..... 64
2.4 Global strength analysis under oblique equivalent quasi-static waves of a ship hull shape with geometric non-linearities, by the 1D-beam method..... 77
2.5 Shipbuilding Classification Societies Rules based equivalent design wave loads..... 122

Chapter 3 Global strength analysis by 3D-FEM full developed ship model, under oblique equivalent quasi-static wave load……..... 125
3.1 Theoretical background..... 125
3.2 The 3D-FEM numerical model of an offshore barge……..... 132
3.3 Numerical results..... 138
3.4 Data assessment..... 189

Chapter 4 Global strength analysis by 3D /1D full extended ship model, in the case of head equivalent quasi-static wave load..... 190

Chapter 5 Global and local strength of ship hull by 3D-FEM models extended on three cargo-holds..... 233
5.1 Modelling procedures by Femap/NX Nastran..... 233
5.2 Modelling with SolidWorks CosmosM program..... 262

Chapter 6 3D-FEM approach for ships' girder global vibrations analysis..... 286

Chapter 7 3D-FEM models approach used for local vibrations of ships panels analysis…… 304
7.1 The transfer function RAO computation for forced vibrations of an isotropic plate..... 304
7.2 Forced local vibrations analysis by 3D-FEM models of an deck panel..... 320
7.3 Numerical and experimental free local vibrations analysis of an deck panel..... 356

References……..... 410
